“On Intention”

The intention is participation in the space of the place in which the event will occur. The attraction is there before the event, as the lepton arrives before the feeling that it carries.

The quality of time varies in the space. Mythical time, the potential for the teller to tell and for the told to be ordered as it arrives from the chaos that is its Matrix, is an available presence.

Chronological or physical time is a function of Earth turning on an axis. The velocity of Earth time varies with the distance from the heat equator. At both poles, North and South, the velocity is close to zero. The magnetic pole, the North Pole, has one time quality, the South Pole may be designated as Ultima Thule, and has another. It has been called the end of the Earth.

All of the above mentioned physical times pertain to physical objects in three dimensions (3D). Two dimensional objects (2D) such as geometrical triangles, take up no space, so they are invisible, although they have qualitative and quantitative presence.

Surfaces and solids are measurable as contained earth, or water, or air. But the wind is not measurable as uncontained air, and the surfaces of flames such as those that consume forests have no measurable surfaces. Sunstorms defy measure.

Reflected light such as moonlight, or light used in phase microscopy is measurable, though moonlight, other than that admitted

into a shutter or a computer, cannot be contained. Moons shine throughout whole solar systems.

Future physical light is anticipated in the imagination which is collective, in that communication by definition requires at least one other entity, be it a grain of sand, or an embodied spirit to serve as object.

Logos is knowledge. Its element is fire burning in the heart of soul. This cold blue flame of desire burns in the watery soul. It may dim as do all autonomous beings, but it always returns as does logos.

Soul is water which having no vessel to contain it runs under the earth and to sea. Any molecule of water evaporated from a surface rises into the air and forms clouds. The clouds are soul containers. Fog is soul with a varying density. Concentrated, fog falls as raindrops. Each drop is a bounded molecule of soul.

In the salt beds by the seaside the sun evaporates the water. Salt crystals are square or rectangular so that salt in solution carries the power of four. This potential will emerge unless the water is poisoned by acids or bases, or else by electrolysis or by a beam such as a laser. A particle which is the result of bombardment such as a microwave particle becomes what is known as irrational since its symmetry in physical nature is destroyed.

Despite the irrationality of all plane circles in 2D that take up no space and are invisible, along with the companion irrationality of all spheres of whatever size in 3D, the flame of knowledge continues immeasurable.
